

PORTFOLIO OVERVIEW

I'm Geoffrey Brennan, a product leader with more than 20 years of experience building software where the technical difficulty is real, the stakes are meaningful, and the product has to earn trust in real operating conditions. My path has moved from industrial design through UX leadership into product management, and each step has shaped how I think about product strategy, customer needs and delivery.

I work best in environments where users depend on the output, the workflow is complicated, and the right answer is not obvious. That has led me across AI manufacturing, healthcare SaaS, clinical tooling and enterprise product management — always in settings where the product has to be both technically credible and operationally useful.

My advantage is the ability to move fluidly between customer pain, product direction and technical trade-offs. I have led projects from discovery and design through roadmap definition, stakeholder alignment and launch. I am comfortable in whiteboard sessions, customer interviews, roadmap reviews and engineering conversations because I understand that product leadership is not just deciding what to build — it is deciding what not to build and what the company can credibly deliver.

Below is a longer-form summary of the work that most clearly demonstrates how I operate across strategy, design and delivery.

SHAPE

WHY THIS WORK MATTERS

Over the years, one theme has remained constant: the most valuable software is not necessarily the most clever, but the one that turns complexity into confidence. In dental practice management, that means reducing administrative friction and preventing avoidable mistakes. In clinical workflows, it means designing tools that fit the way clinicians actually work. In AI manufacturing, it means helping experts trust and adopt systems that can genuinely accelerate their work.

That is the lens I bring to product management: not just market needs, but trust, usability and operational reality. It is a practical, grounded way of leading product, and it is what has made my work repeatable across different domains.

CASE STUDIES

01 — Roles and permissions overhaul

ROLE UX TEAM LEAD → PRODUCT MANAGER

FOCUS ACCESS CONTROL & USER MANAGEMENT

COMPANY CURVE DENTAL

OUTCOME 9-MONTH PATH TO GA

Curve Dental's existing roles-and-permissions system was a genuine business liability. It was rigid, difficult to use, hard to administer, and not flexible enough to support a wide range of practice structures. This created real problems for sales, customer success and internal security: deals stalled in demos, practices struggled to manage access correctly, and the system could not meaningfully separate duties in a way that protected the business from fraud and operational error.

As UX team lead, I began by digging into the underlying customer behaviour rather than jumping to a design answer. I conducted interviews and design validation work with practice administrators, owner-operators and stakeholders across engineering, sales and customer success. I also worked closely with architecture and engineering teams to understand what the backend could support and where constraints would shape the solution. That early alignment was critical because the problem was larger than interface design — it required a better understanding of how customers actually structured permissions and how the platform needed to scale.

The result was a more granular, centralised administration model built to support both small offices and multi-site DSOs. It included much stronger role definitions, better visibility into who had access and why, location-aware controls, and a user directory designed around real administrative needs rather than assumptions. I then carried the project through to product management, helping sequence rollout, align stakeholders and guide implementation toward general availability.

This work showed me something important: some of the highest-leverage product work is not flashy, but it is foundational. When access control and admin workflows are badly designed, they create friction throughout the business and limit revenue. By reworking the system properly, we removed a meaningful bottleneck in the product and improved the trust customers placed in the platform.

02 — Perio charting rebuild

ROLE UX TEAM LEAD / LEAD DESIGNER

FOCUS CLINICAL WORKFLOW REDESIGN

COMPANY CURVE DENTAL

OUTCOME 10× USAGE INCREASE

Periodontal charting is a clinical workflow that is both extremely common and extremely demanding. Hygienists gather a large amount of data quickly, often under time pressure, and the workflow has to support multiple individual preferences without compromising speed or accuracy. The existing module in

Curve Dental was built in Flash and had become technically obsolete. On top of that, it was confusing enough that users often reverted to paper records instead of entering data directly into the system.

The challenge was not simply to recreate an old feature in a new stack. The real task was to rebuild a workflow that actually matched how clinicians work. I led this effort as design lead, working directly with dental professionals to understand the variation in exam practices, the sequence of charting, and the type of data that mattered most. That process surfaced a critical insight: there was no single correct pathway for periodontal exams. Hygienists disagreed on start conditions, order of measurement and which metrics mattered most, and the product had to accommodate those differences rather than forcing a single workflow onto the entire user base.

I designed a solution that paired anatomical accuracy with flexibility: a graphical mouth view for orientation, a tabular data-entry model for measurement, keyboard-first interactions for speed, and configurable exam behaviour that could adapt to different practice styles. We used SVG-based graphics and prototype testing to validate both the operational logic and the visual structure, then refined the product through alpha and beta feedback before general availability.

The result was a clear increase in product usage and a meaningful improvement in perceived quality. What had once been a feature users avoided became one of the product's defining strengths. That experience reinforced my belief that the strongest product decisions come from close observation of real users and a willingness to design for variability rather than the mythical average customer.

03 — Billing system update

ROLE LEAD DESIGNER / PRODUCT MANAGER

FOCUS BILLING WORKFLOW REFINEMENT

COMPANY CURVE DENTAL

OUTCOME FASTER, CLEARER AND MORE SCALABLE BILLING

Billing is one of those product areas that does not get the glamour of new features, but it absolutely determines whether a platform feels trustworthy to users. The billing module was being rebuilt to improve usability, performance and scalability while keeping the fundamental workflows familiar enough for customers to adopt without confusion. This is exactly the kind of project where design quality and product discipline matter: a small improvement in visibility or logic can reduce support issues, accelerate daily accounting tasks and cut accidental data-entry errors.

I was involved from concept through delivery, helping define the user experience and then carrying product responsibility through the implementation and release stages. The redesign focused on making repeated actions more visible, separating task flows more cleanly, and making the ledger easier to scan. It included improved filtering, smarter defaults, clearer invoice and payment flows, and stronger visibility into account status. These are not glamorous changes, but they are the sort of foundational updates that make complex software feel dependable.

What made the project successful was keeping the familiar shape of the workflow while creating clearer and more focused interactions. That balance matters: large improvements in backend capability and UI clarity should not come at the cost of forcing users to relearn the entire process. The end result was a billing experience that felt faster, more robust and better aligned with practice workflows, while also giving the product a stronger foundation for future feature work.

04 — Teaching AI to think like a CNC programmer

ROLE SENIOR PRODUCT MANAGER

COMPANY CLOUDNC

FOCUS AI MANUFACTURING SOFTWARE

OUTCOME PRODUCTION AI PRODUCT FOR CNC WORKFLOWS

CloudNC is the clearest example of the work I do at the intersection of product strategy, technical depth and trust-building. The challenge was not simply to add AI to a workflow; it was to help CNC programmers adopt a system that could generate pragmatic machining strategies in a domain where the consequences of a bad decision are immediate and expensive. Every recommendation has to stand up to the realities of machine physics, tolerances and production constraints.

I work directly with machinists, engineers, customers and AI researchers to define what value the product can credibly generate and how that value should surface inside the real production workflow. That means focusing on the points where automation reduces repetitive cognitive load without asking users to surrender judgment. It also means building system confidence through transparency, clear constraints and iterative feedback loops.

The result is a production-grade AI product that helps users move faster without compromising technical credibility. It is a strong example of the product leadership mode I use across domains: understand the

underlying constraint, validate customer pain, translate that into a defensible roadmap, and keep the technical depth close to the product decision.

A FEW MORE THINGS I'VE BUILT

Product Company Simulator: A strategy game built to demonstrate how product decisions, hiring, sales pressure and engineering trade-offs compound over time. It helps people understand the operational consequences of product leadership decisions in a fast-moving SaaS environment.

PM Project Workbench: A planning and discovery tool inspired by my own product workflow. It structures early-stage initiative thinking so teams can challenge assumptions, test key questions and align on the work before large technical commitments are made.

Vessel Generator: A generative 3D design prototype created to explore AI-assisted workflows in a design-heavy environment. It reflects my interest in taking concept work into usable, testable prototypes rather than static mockups.

UX Lens Prototype: An AI-assisted UX evaluation concept exploring how product managers, designers and researchers can use structured analysis to surface quality issues and identify better opportunities for improvement.

PRODUCT LEADERSHIP APPROACH

The common thread across these projects is not just UX or strategy in isolation — it is disciplined product leadership. I work by starting with the real constraint, validating assumptions with users and stakeholders, then translating the underlying need into a product decision the team can execute confidently. I care about roadmap sequencing, trust, rollout quality and measurable outcomes, not just the appearance of a feature.

Discovery before definition	Research that changes the plan	Roadmaps built on real constraints
Clear decisions, not noisy debate	Designs that are operationally realistic	Delivery that protects trust

CAREER SUMMARY

2023 — PRESENT	Senior Product Manager	CloudNC	LONDON
2021 — 2023	Senior Product Designer	Qlearsite	LONDON
2019 — 2021	Product Manager	Curve Dental	CALGARY
2017 — 2019	UX Team Lead	Curve Dental	CALGARY
1996 — 2001	MEDes, Industrial Design	University of Calgary	—
